*technologies & tools, inc.*

The background features a close-up of a red, polished polycrystalline diamond (PCD) drill bit with a double-flute design, positioned vertically. The bit is set against a dark, textured background with a grid of circular perforations. In the upper right, there is a faint, white technical drawing of an aircraft fuselage section, showing internal structural details and components.

***STF Precision is proud to announce that we are now producing a full line of polycrystalline diamond drills & countersinks.***

***Superior Diamond makes a Superior Drill***

Most of our competitors sinter or press diamond powder into a slotted helix, a tricky prospect resulting in PCD that is soft and wears quickly. We buy thick pieces of prepressed diamond straight from the world's leading manufacturers, who spend millions developing the best PCD.

A thin layer of titanium bonds the diamond to the carbide body. Then using the latest grinding and diamond erosion equipment we shape the diamond into a true helix and finish the drill point.

***The result is a drill with exceptional wear and chip resistance.***
